## BEER MAKING COMPANION: BRUXELLES BLONDE

# **Brewshop**

### 1 GAL

#### **KIT INCLUDES:**

- 1 Gallon Fermentation Jug
- Screw Cap Stopper
- Airlock
- Racking Cane
- Tubing
- Tube Clamp
- 12" Lab Thermometer
- Sanitizer Packet
- Ingredient Mix

#### EQUIPMENT NOT INCLUDED BUT NEEDED:

- 6 quart Stock Pot (a second pot is handy)
- Fine Mesh Strainer
- Funnel
- 2 Weeks After Your Brew Day: 10 Empty Non-Twistoff Bottles (Swingtops such as Grolsch work great if you do not have the capper)

#### INGREDIENTS NOT INCLUDED BUT NEEDED:

- 3 tablespoons honey
- Ice

#### **Pre-Brew: Sanitize**

You might be surprised to learn that sanitization might actually be the most important thing here. If things are not completely clean, your yeast will die. You will not drink good beer, and the next few steps will only provide you with a valuable learning experience instead of a decidedly more valuable drinking experience.

- Dissolve half of your sanitzer packet with a gallon of water in a container. Save the second half for when you bottle.
- Soak everything you are going to use, rinse with water, and let air dry on some paper towels. If it isn't totally dry when you are ready to start don't worry.
- Keep the extra sanitizer in a container for now. Chances are you'll want to re-sanitize something later.
- NOTE: Follow the instructions on your sanitizer. Sanitizers are different. C-Brite should be rinsed off. StarSan does not need to be. Brooklyn Brew Shop's Sanitizer is also no rinse. One packet makes two gallons. Use half for brewing and half for bottling.

#### The Mash

- Heat 2 quarts (1.9 liters) of water to 160°F (71°C).
- Add grain (This is called "mashing in." Take note of jargon. Or don't).
- Mix gently with spoon or spatula until mash has consistency of oatmeal. Add water if too dry or hot. Temperature will drop to ~150°F (66°C).
- Cook for 60 minutes at 144-152°F (63-68°C). Stir every 10 minutes, and use your thermometer to take temperature readings from multiple locations.
- You likely don't need to apply heat constantly. Get it up to temperature, then turn the heat off. Monitor, stir, and adjust accordingly to keep in range.
- After 60 minutes, heat to 170°F (77°C) while stirring constantly ("Mashing Out").

## 2

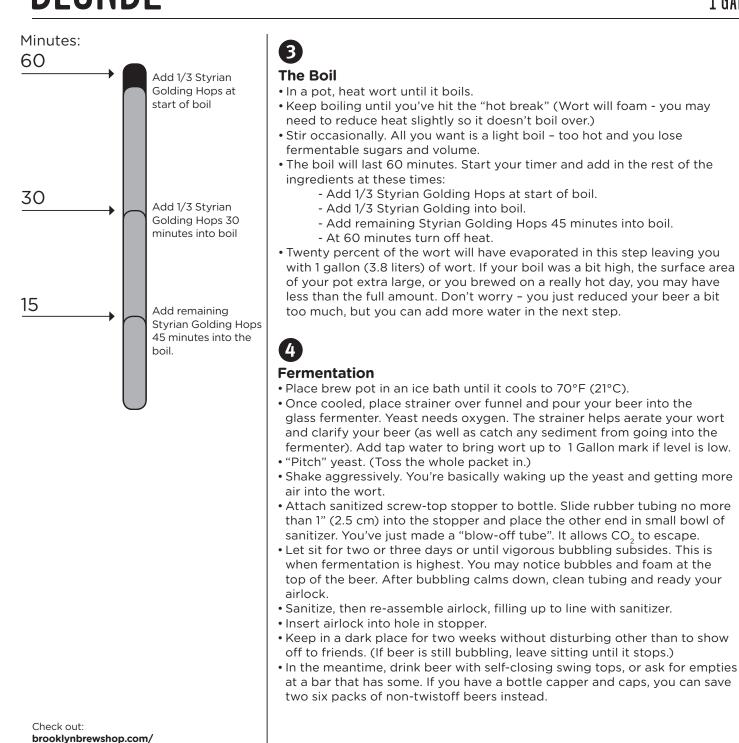

#### The Sparge

- Heat additional 4 quarts (3.8 liters) of water to 170°F (77°C).
- Set up your "lauter tun" (a strainer over a pot).
- Carefully add the hot grain mash to the strainer, collecting the liquid that passes through.
- This liquid is called "wort" (pronounced "wert"). It will be your beer.
- Slowly and evenly pour 170°F (77°C) water over the mash to extract the grain's sugars.
- You want to collect 5 quarts (4.75 liters) of wort. You will lose about 20% to evaporation later on, so you want to start with a bit more than you'll end with.
- Re-circulate wort through grain once.

### 5

#### Two Weeks Later: Bottling

- Thoroughly rinse bottles with water, removing any sediment.
- Mix remaining sanitizer with water.
- Fill each bottle with a little sanitizer and shake. Empty after two minutes, rinse with cold water and dry upside down.
- Attach sanitized tubing to the short curved end of your sanitized racking cane. Attach the black tip to the other end it will help prevent sediment from getting sucked up.
- It will probably be a snug fit, but you can get it on there.
- Dissolve 3 tablespoons honey with 1/2 cup water. Pour into a sanitized pot.
  Carbonation comes from adding sugar when bottling, so if you filled your jug with less than the full gallon in the last step, use less honey when bottling. Using the full amount can result in your beer being over-carbonated.
- Siphoning (It all happens pretty fast. You may want to practice on a pot of water a few times). To see it in action first, watch the How to Bottle video at brooklynbrewshop.com/instructions.
  - Fill tubing, but not racking cane, with sanitizer.
  - Hold tubing below top of racking cane so sanitizer doesn't pour into your beer.
  - Remove stopper and place racking cane into jug, just above the sediment at the bottom ("trub").
  - Lower end of tubing not connected to racking cane into sink so that sanitizer flows out. Suction will force beer up and through the racking cane and tubing.
  - Let sanitizer flow into sink until beer just starts to flow out of the tubing, then clamp shut. Open clamp on tubing, allowing beer to flow into pot with sugar solution.
  - Tilt jug when beer level is getting low, but be careful in not sucking up the trub.
  - Siphon beer from pot into bottles, pinching tube clamp to stop flow after each bottle.
- Close bottles.
- Store in a dark place for 2 weeks.

## 6

#### Two Weeks Later: Enjoying

- Put beers in the fridge the night before you drink them.
- Drink. Share with friends if you're the sharing type.

#### Plan Your Next Brew.

Vist Brooklyn Brew Shop at the Brooklyn Flea or online at brooklynbrewshop.com
